MERN STACK

TRAINING TR-103 REPORT DAY 28

27 July 2026

Overview:

Day 28 of the MERN Stack training focused on developing the Signup Page for the CareerConnect – Career Management System. I learned how to create a user registration form using React.js, manage registration details using the useState() Hook, and send user information to the backend using the Fetch API. The Signup Page allows new users to register by entering their name, email, password, and selecting their user role. The registration details are sent to the backend through a POST request and stored in the MongoDB database after successful registration.

Learning Objectives:

- Understand Signup Page development using React.js.
- Learn how to create a user registration form.
- Manage registration input values using `useState()`.
- Send registration data to the backend using the Fetch API.
- Understand POST requests for user registration.
- Store user registration details in MongoDB.
- Understand role selection during registration.
- Handle successful and failed registration responses.
- Reset the registration form after successful signup.

Project: CarrerConnect – Carrer Guidance and Management System

SIGNUP PAGE DEVELOPMENT

• The Signup Page is developed as a user registration module for the CareerConnect career management system.

• It allows new users to create an account and register themselves in the application.

• The useState() hook is used to manage user input values and store registration details.

• The Signup Page collects the following user information:

1. Full Name
2. Email Address
3. Password
4. User Role

• The role selection allows users to register according to their role in the CareerConnect system,

1. Student
2. Recruiter

• When the user clicks the Sign Up button, the handleSignup() function is executed.

• The entered registration details are sent to the backend server using the Fetch API.

• User registration data is sent to the backend in JSON format:

1. Name
2. Email
3. Password
4. Role

• The backend receives the registration request and stores the new user's information in the MongoDB database.

Working

1. The Signup Form is created to handle new user registration in the CareerConnect application.
2. `useState()` is used to store user details such as name, email, password, and role.
3. The user enters their required registration details into the provided input fields.
4. The user selects their role according to their purpose in the CareerConnect application.
5. When the **Sign Up** button is clicked, the `handleSignup()` function is executed.
6. The `handleSignup()` function collects the entered registration information.
7. The registration data is sent to the backend using the Fetch API and a POST request.
8. The backend receives the registration request and processes the user information.
9. The backend stores the new user's details in the MongoDB database.
10. After successful account creation, the signup form is reset and the entered fields are cleared.
11. The user is redirected or provided an option to navigate to the Login Page.
12. If any error occurs during registration, the system displays an appropriate error message.

Purpose

The purpose of the Signup Page is to provide a simple and efficient registration process for new users of the CareerConnect system. It allows users to create accounts, select their appropriate role, and store their information in the database so that they can later authenticate through the Login Page and access the relevant CareerConnect features.

Conclusion:

By the end of Day 28, I gained a clear understanding of developing a Signup Page for the CareerConnect – Career Management System. I learned how to create a user registration form using React.js, manage form values using the useState() Hook, send registration details to the backend using the Fetch API, and store user information in the MongoDB database. I also learned how to implement role selection, handle successful and failed registration responses, and reset the form after successful signup. This strengthened my understanding of React forms, API integration, POST requests, MongoDB data storage, and user registration in MERN Stack applications.
