**MERN STACK**

# TRAINING TR-103 REPORT DAY 29

**28 July 2026**

## Overview:

Day 29 of the MERN Stack training focused on developing the User Schema for the CareerConnect – Career Management System using Mongoose and MongoDB. We learned how to define the structure of user data stored in the database and create a User model using the Mongoose schema. The User Schema stores important information required for user registration, authentication, and career-related activities. It also helps maintain a structured and organized format for storing user information in MongoDB.

## Learning Objectives:

- Understand the purpose of a User Schema.
- Learn how to create schemas using Mongoose.
- Define different fields required for user data.
- Understand data storage in MongoDB.
- Learn how to create a Mongoose model.
- Understand the use of user roles in CareerConnect.
- Store user information in a structured format.
- Use the User model with Signup and Login APIs.

## Project: CarrerConnect – Carrer Guidance and Management System

# USER SCHEMA DEVELOPMENT

The User Schema is created using Mongoose to define the structure of user data stored in the MongoDB database.

• It is used to store user information required for registration, authentication, and career management operations.
• The User Schema is connected with the User model using:

```
mongoose.model("User", userSchema)
```

• The User Schema contains the following fields:

1. **Name** : Stores the user's full name.
2. **Email**
    a. Stores the user's email address.
    b. The email is used for user identification and authentication.
3. **Password** : Stores the user's password for authentication.
4. **Usertype** : Stores the type of user such as:
    a. Student
    b. Recruiter
    c. Admin
5. **Profile Details** : Stores career-related information of the user such as:
    a. Qualification
    b. Skills
    c. Contact Information
    d. Resume

• The schema helps maintain a structured format for storing user-related data in MongoDB.

## Working

1. The mongoose.Schema() function is used to create the structure of user documents.
2. User details such as name, email, password, and usertype are defined inside the schema.
3. Career-related profile information is added according to the requirements of the application.
4. The User model is created using the defined schema.
5. The User model is connected with the MongoDB database.
6. The User model is used in Signup and Login APIs to store and retrieve user information.

# Conclusion:

By the end of Day 29, I gained a clear understanding of creating a User Schema using Mongoose for the CareerConnect – Career Management System. I learned how to define user fields, create a User model, connect the model with MongoDB, and store user information in a structured format. I also understood how the User model can be used with the Signup and Login APIs and how `usertype` helps identify different users and support role-based functionality. This strengthened my understanding of Mongoose schemas, MongoDB data storage, models, user management, and backend development in MERN Stack applications.
