MERN STACK

TRAINING TR-103 REPORT DAY 32

31 July 2026

Overview:

Day 32 of the MERN Stack training focused on developing the Admin Dashboard for the CareerConnect – Career Management System. I learned how to create an admin dashboard using React.js that displays important information about users, jobs, and applications. The dashboard fetches data from the backend using the Fetch API, while the backend retrieves and processes data from MongoDB through an Admin Dashboard API.

Learning Objectives:

- Understand the working of an Admin Dashboard.
- Learn how to display dynamic statistics in React.
- Use useState() to manage dashboard data.
- Use useEffect() to fetch data when the page loads.
- Create an Admin Dashboard API using Express.js.
- Retrieve data from MongoDB.
- Calculate user, job, and application statistics.
- Display backend data dynamically in the frontend.

Project: CarrerConnect – Carrer Guidance and Management System

Admin Dashboard API Development

• The Admin Dashboard API is created using Express.js to provide overall system statistics.

• The API retrieves user, job, and application information from MongoDB.

API Endpoint:

```
GET /admin-dashboard
```

• User records are fetched from MongoDB using:

```
User.find()
```

• Job and application records are retrieved from the respective collections.

• The API calculates important statistics such as:

1. Total Users
2. Total Students
3. Total Recruiters
4. Total Jobs
5. Total Applications
6. Pending Applications

Working

1. The `AdminDashboard()` component is created to display admin statistics.
2. The component sends a request to the Admin Dashboard API using the Fetch API.
3. The backend retrieves user, job, and application details from MongoDB.
4. The required statistics are calculated from the database records.
5. The API sends the dashboard information to the frontend.
6. The received data is stored using React state.
7. The administrator can monitor CareerConnect activities through dashboard cards.

Conclusion:

By the end of Day 32, I gained a clear understanding of developing an Admin Dashboard using React.js, Express.js, and MongoDB. I learned how to fetch backend data using the Fetch API, manage dashboard information using `useState()`, automatically load data using `useEffect()`, and display dynamic statistics. This strengthened my understanding of React Hooks, API integration, MongoDB data retrieval, dashboard development, and backend API development in MERN Stack applications.
