MERN STACK

TRAINING TR-103 REPORT DAY 33

1 August 2026

Overview:

Day 33 of the MERN Stack training focused on developing the **User Dashboard** for the **CareerConnect – Career Management System**. We learned how to create a personalized dashboard where users can view their profile information, available jobs, applications, and career activities. The dashboard fetches user-specific data from the backend using the Fetch API and displays it dynamically using React state.

Learning Objectives:

- Understand the working of a User Dashboard.
- Display user-specific information.
- Use `useState()` to manage dashboard data.
- Use `useEffect()` to fetch data when the dashboard loads.
- Retrieve the logged-in user's ID from `localStorage`.
- Create a User Dashboard API using Express.js.
- Retrieve user data from MongoDB.
- Display jobs and application information dynamically.

Project: CarrerConnect – Carrer Guidance and Management System

User Dashboard Development

• The User Dashboard is developed to provide users with their personal career information and activities.

• It allows users to view profile details, available jobs, application history, and application status.
• The useState() hook is used to store user dashboard data received from the backend.
• The useEffect() hook is used to fetch user information when the dashboard loads.
• The logged-in user's ID is retrieved from localStorage.
• The User Dashboard fetches user details using the API:

```
GET /user-dashboard/:id
```

• The dashboard displays:

1. User Name
2. Email Address
3. Skills
4. Total Applications
5. Pending Applications
6. Available Jobs

• Quick action options are provided for:

- View Jobs
- My Applications
- Profile

USER DASHBOARD API DEVELOPMENT

• The User Dashboard API is created using **Express.js** to retrieve user-specific information.
• The API uses the logged-in user's ID to fetch data from MongoDB.

API Endpoint:

```
GET /user-dashboard/:id
```

• User information is retrieved using:

```
User.findById(req.params.id)
```

• The API returns:

1. User Details
2. Profile Information
3. Application Records
4. Available Jobs

• The response is sent to the frontend in JSON format.

Working

1. The UserDashboard() component is created to display user information.
2. The user ID stored in localStorage is retrieved.
3. A request is sent to the User Dashboard API.
4. The backend searches for user details using the provided ID.
5. User profile and application information are retrieved from MongoDB.
6. The API returns the required dashboard data.
7. The frontend displays user and career-related information.
8. Users can navigate to jobs and applications using quick action options.

Conclusion:

By the end of Day 33, I gained a clear understanding of developing a User Dashboard using React.js, Express.js, and MongoDB. I learned how to retrieve user-specific data, use

`useState()` and `useEffect()`, fetch information through an API, and display profile, job, and application details dynamically in the CareerConnect application.
