MERN STACK

TRAINING TR-103 REPORT DAY 35

4 August 2026

Overview:

Day 35 of the MERN Stack training focused on developing the Job Details and Apply Now Modules for the CareerConnect – Career Guidance and Management System. I learned how to display detailed information about selected job opportunities, including job title, company name, location, salary, required skills, and qualifications. The Job Details module retrieves job-related information from the backend and displays it dynamically using React components. The Apply Now module allows users to apply for suitable positions by submitting the required information through an application form. These modules integrate the React frontend with Express.js and MongoDB to retrieve job details, validate application information, and store application records in the database.

Learning Objectives:

- To understand the development of job details and job application modules using the MERN Stack.
- To learn how to retrieve specific job records from MongoDB.
- To understand API development and request handling using Express.js.
- To implement communication between React frontend components and backend APIs.
- To learn how to validate user input before submitting an application.
- To understand how job applications can be stored and associated with users and job listings.

Project: CarrerConnect – Carrer Guidance and Management System

JOB DETAILS MODULE DEVELOPMENT

- The Job Details module is developed to display detailed information about a selected job.
- When a user selects a job from the available job listings, the system displays its complete information.
- The module retrieves job data from the backend using the job ID.

Job Details Include

1. Job Title
2. Company Name
3. Job Location
4. Job Type
5. Salary Details
6. Required Skills
7. Job Description
8. Qualification and Experience Requirements
9. Application Deadline
    - The module displays job information in a user-friendly format.
    - Users can review the job requirements before applying.
    - The module helps candidates determine whether a particular job matches their qualifications, skills, and career interests.
    - The Apply Now option is provided to allow users to proceed with the application process.

APPLY NOW MODULE DEVELOPMENT

- The Apply Now module is developed to allow registered users to submit applications for available job positions.

- The module collects the necessary information from the user and associates the application with the selected job.
- The application details are sent from the frontend to the backend for processing and storage in MongoDB.
- The system verifies the required application details before submitting the application.

Application Details Include

1. Applicant Name
2. Applicant Email
3. Selected Job ID
4. Resume or Resume URL
5. Cover Letter, if required
6. Application Date
7. Application Status
    - After the user submits the application, the backend processes the request.
    - If the application is valid, the application record is stored in the database.
    - The application status can initially be set to **Applied** or **Pending**, depending on the application's status design.
    - The system can prevent duplicate applications for the same job by checking existing application records.
    - A confirmation message is displayed after successful submission.

JOB DETAILS API DEVELOPMENT

- The Job Details API is developed using Express.js to retrieve information about a specific job.
- The API receives the job ID and fetches the corresponding job record from MongoDB.

API Endpoint

```
GET /job-details/:jobId
```

- The API retrieves job details using the provided job ID.
- The backend searches for the selected job in the database.
- If the job exists, the API returns its details to the frontend.
- If the job is unavailable, an appropriate error response is returned.

Working

1. The user opens the job listings page.
2. The user selects a particular job.
3. The frontend sends a request to the Job Details API.
4. The backend retrieves the job information from MongoDB.
5. The API returns the job details to the frontend.
6. The Job Details component displays the information.

APPLY NOW API DEVELOPMENT

- The Apply Now API is developed using Express.js to process job applications submitted by users.

- The API receives the applicant details and selected job information from the frontend.
- The backend validates the submitted data before saving the application.

API Endpoint

```
POST /apply-job
```

API Working

1. The frontend collects the required application details.
2. The user clicks the Apply Now button.
3. The frontend sends the application data to the backend.
4. The backend validates the applicant details and selected job.
5. The system checks whether the job exists and is available for applications.
6. The backend checks for duplicate applications, if this feature is implemented.
7. If all validations pass, the application record is saved in MongoDB.
8. The backend returns a success response.
9. The frontend displays an application confirmation message.

Data Stored in MongoDB

- Applicant Information
- Job Reference ID

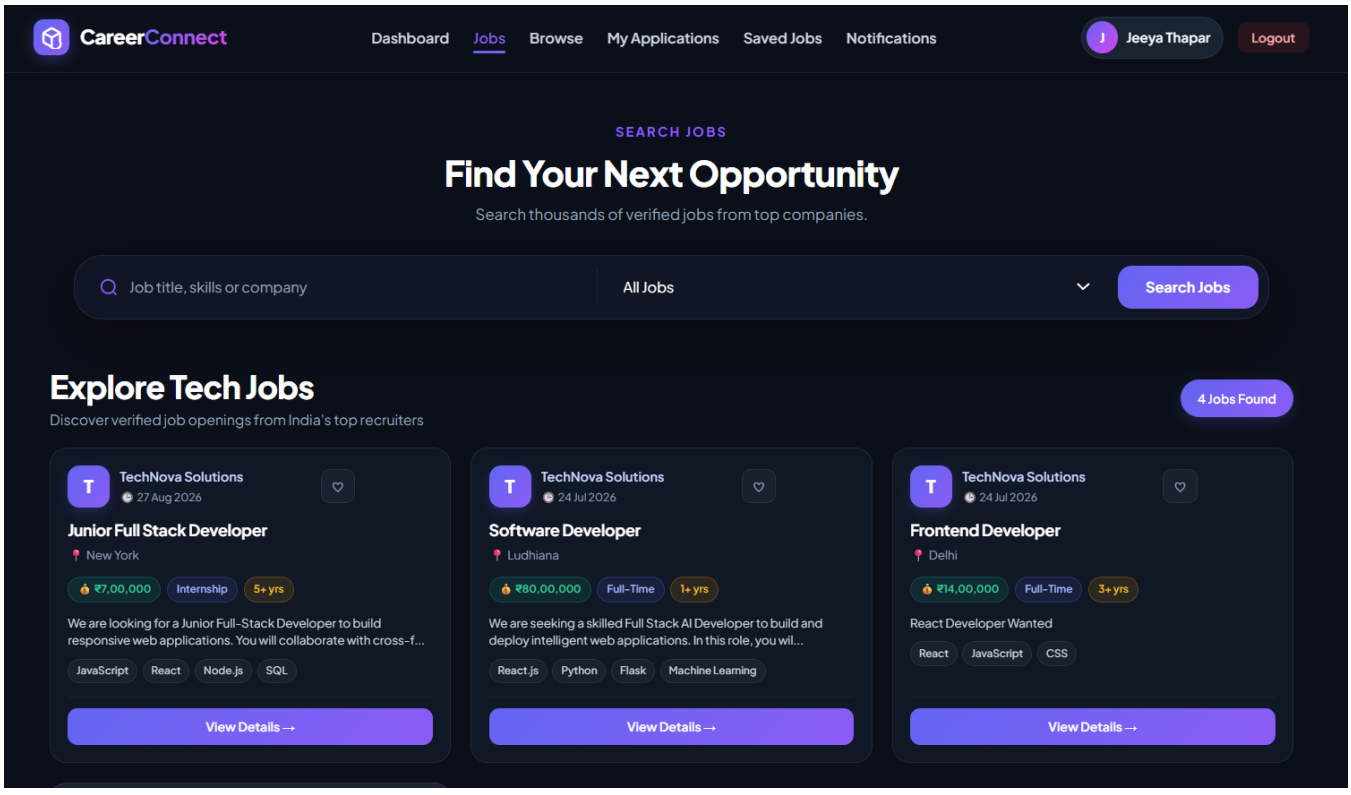

- Resume Details
- Application Date
- Application Status
- The application record can be associated with the relevant user and job using MongoDB document references.

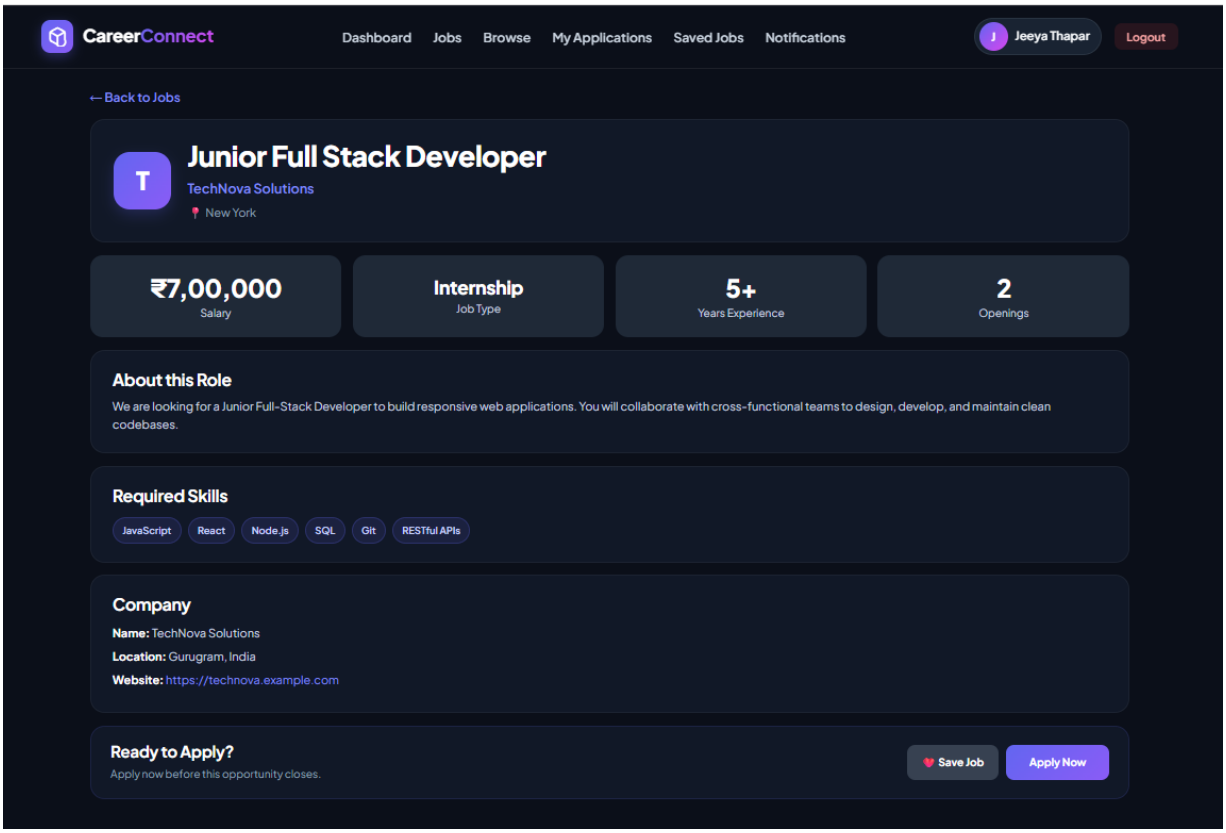

WORKING OF JOB DETAILS AND APPLY NOW MODULES

- The user opens the Job Listings page.
- The system displays available job opportunities.
- The user selects a job to view its details.
- The Job Details module retrieves and displays the selected job information.
- The user reviews the job description, salary, location, skills, and qualifications.
- The user clicks the Apply Now button.
- The application form collects the required information.
- The frontend sends the application request to the backend.
- The backend validates the application details and checks job availability.
- The application is stored in MongoDB if all validations are successful.
- The user receives a confirmation message.
- The submitted application can be used by the system to support further application tracking, if that feature is available.

Conclusion

By the end of Day 35, I gained a clear understanding of developing a Jobs and Applications module using React.js, Express.js, and MongoDB. I learned how to retrieve job information through APIs, manage job data using useState() and useEffect(), implement job searching functionality, and submit applications through the CareerConnect application. I also understood how the frontend communicates with the backend to store and retrieve career-related information dynamically.

About this Role
We are looking for a Junior Full-Stack Developer to build responsive web applications. You will collaborate with cross-functional teams to design, develop, and maintain clean codebases.
Required Skills
JavaScript
React
Node.js
SQL
Git
RESTful APIs
Company
Name: TechNova Solutions
Location: Gurugram, India
Website: https://technova.example.com
