**MERN STACK**

# TRAINING TR-103 REPORT DAY 36

**5 August 2026**

## Overview:

Day 36 of the MERN Stack training focused on developing the Saved Jobs module for the CareerConnect – Career Guidance and Management System. I learned how to implement a feature that allows users to bookmark job opportunities and access them later through a dedicated Saved Jobs page. The module retrieves and displays saved job information dynamically using React.js and communicates with the backend through Express.js REST APIs. MongoDB is used to store and manage the relationship between users and their saved jobs. Users can save jobs, view their details, and remove jobs from their saved list when required. This module improves the job-search experience by helping users organize and track interesting career opportunities.

## Learning Objectives:

- To understand the development of the Saved Jobs module using the MERN Stack.
- To learn how to save and retrieve job records from MongoDB.
- To understand REST API integration between React.js and Express.js.
- To use the `useState()` and `useEffect()` hooks for managing and fetching saved job data.
- To implement functionality for saving, displaying, and removing bookmarked jobs.
- To understand how user records can be associated with job listings.
- To learn how to prevent duplicate saved job entries.
- To improve knowledge of database operations, frontend-backend communication, and dynamic data rendering.

# Project: CarrerConnect – Carrer Guidance and Management System

## SAVED JOBS MODULE

- The Saved Jobs module is developed to allow users to save job opportunities they are interested in and view them later.
- It enables users to bookmark suitable job listings for future reference without searching for the same jobs again.
- The module is implemented using React.js for the frontend and Express.js with MongoDB for backend operations.
- The `useState()` hook is used to manage saved job information, loading states, and success or error messages.
- The `useEffect()` hook is used to automatically fetch the saved jobs when the Saved Jobs page is opened.
- The module retrieves job information associated with the logged-in user and displays it dynamically.
- Users can view saved job details, navigate to the job description, and proceed to apply for suitable positions.
- Users can also remove jobs from their saved list when they are no longer interested in them.
- The Saved Jobs module communicates with the backend through REST APIs to store, retrieve, and remove saved job records.
- MongoDB is used to maintain the relationship between users and their saved job listings.

## SAVED JOBS API DEVELOPMENT

The Saved Jobs APIs are developed using Express.js to manage job bookmarking functionality and store saved job information in MongoDB.

### 1. Save Job API

**POST `/saved-jobs`**

- Allows users to save a selected job to their saved jobs list.
- Receives the user ID and job ID from the frontend.
- Checks whether the selected job exists in the database.
- Prevents duplicate entries if the user has already saved the same job.
- Stores the saved job reference in the database after successful validation.
- Returns a success message after the job is saved.

### 2. Get Saved Jobs API

**GET `/saved-jobs/:userId`**

- Retrieves all saved jobs associated with a specific user.
- Fetches the user's saved job records from MongoDB.
- Retrieves relevant job information, such as job title, company name, location, salary, and job type.
- Sends the saved job data to the frontend.
- The frontend displays the saved jobs in an organized format.

**3. Remove Saved Job API**

**DELETE `/saved-jobs/:userId/:jobId`**

- Allows users to remove a selected job from their saved jobs list.
- Receives the user ID and job ID as parameters.
- Identifies the selected saved job record.
- Removes the job reference from the user's saved jobs list.
- Updates the database and returns a confirmation response.
- The frontend refreshes the saved jobs list after successful removal.

**WORKING OF THE SAVED JOBS MODULE**

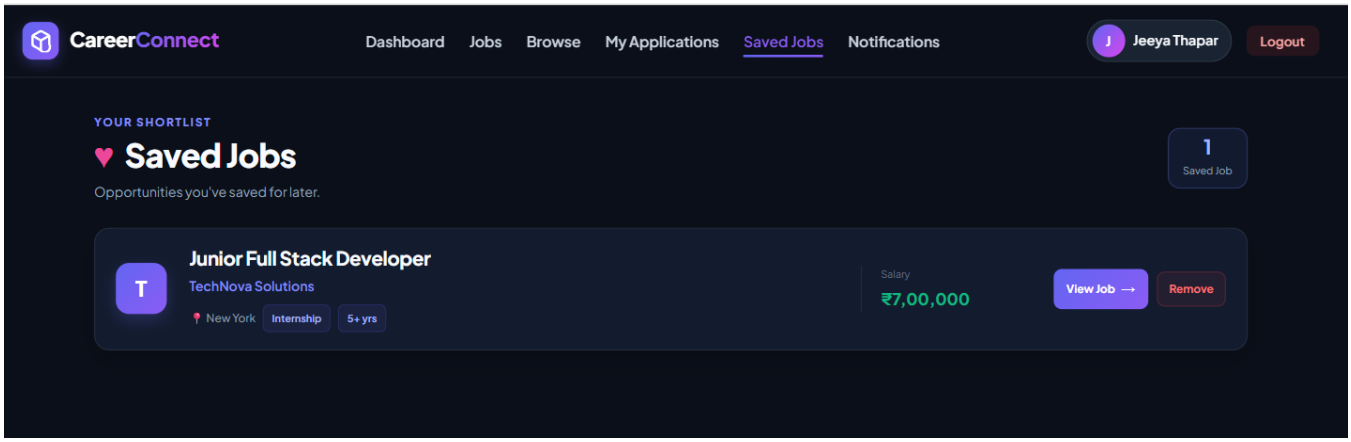

1. The user logs in to the CareerConnect – Career Guidance and Management System.
2. The user opens the Job Listings page to explore available job opportunities.
3. The system fetches job information from the backend and displays the available jobs.
4. The user selects a suitable job and clicks the Save Job or Bookmark option.
5. The frontend sends a request to the Save Job API.
6. The backend validates the request and checks whether the job has already been saved.
7. If the request is valid, the selected job is added to the user's saved jobs records in MongoDB.
8. The user opens the Saved Jobs page to view previously saved job opportunities.
9. The frontend fetches the saved job records using the Get Saved Jobs API.

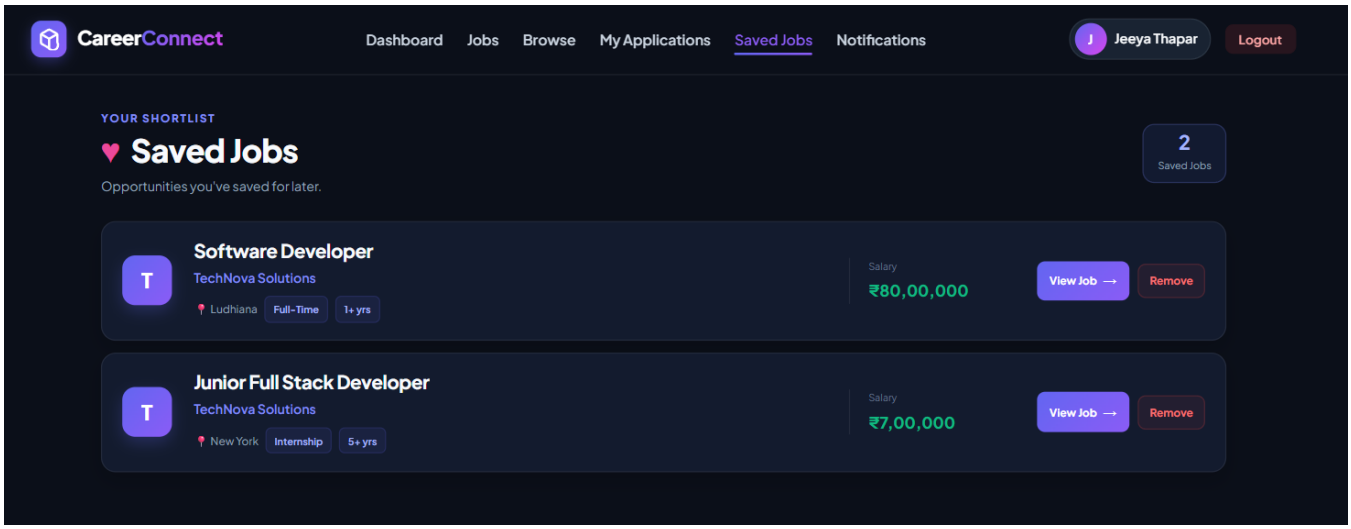

10. The saved jobs are displayed with relevant details, such as job title, company name, location, and salary.

11. The user can select a saved job to view its complete details and proceed to the Apply Now module.

# Conclusion

By the end of Day 35, I gained a clear understanding of developing a Jobs and Applications module using React.js, Express.js, and MongoDB. I learned how to retrieve job information through APIs, manage job data using useState() and useEffect(), implement job searching functionality, and submit applications through the CareerConnect application. I also understood how the frontend communicates with the backend to store and retrieve career-related information dynamically.
