MERN STACK

TRAINING TR-103 REPORT DAY 38

7 August 2026

Overview:

Day 38 of the MERN Stack training focused on developing the Recruiter Dashboard and Company Management functionality for the CareerConnect – Career Guidance and Management System. I learned how to create a dashboard that allows recruiters to view, add, and update company information. The module uses React.js to display company details dynamically and communicates with the backend through Express.js REST APIs. MongoDB is used to store and retrieve company records. This functionality helps maintain organized company profiles and supports their integration with job listings, allowing job seekers to access relevant company information while exploring career opportunities.

Learning Objectives:

- To understand the development of a Recruiter Dashboard using the MERN Stack.
- To learn how to create and update company profiles.
- To understand REST API development using Express.js.
- To retrieve and manage company records in MongoDB.
- To use the `useState()` and `useEffect()` hooks in React.js.
- To understand frontend-backend communication.
- To learn how company information can be associated with recruiters and job listings.

Project: CarrerConnect – Carrer Guidance and Management System

RECRUITER DASHBOARD – COMPANY MANAGEMENT

The Recruiter Dashboard module is developed to allow recruiters to manage company information and job-related activities within the CareerConnect system.

- The Recruiter Dashboard provides a centralized interface for recruiters to manage their company profiles and job postings.
- It allows recruiters to add and update company details, view company information, and manage their recruitment activities.
- The module is implemented using React.js for the frontend and Express.js with MongoDB for backend operations.
- The `useState()` hook is used to manage company information, form inputs, loading states, and success messages.
- The `useEffect()` hook is used to fetch company details when the Recruiter Dashboard is opened.
- The dashboard retrieves recruiter-specific company information from the backend through REST APIs.
- Recruiters can maintain company details such as company name, location, description, website, and contact information.
- The company information can be used in job listings to help candidates understand the organization offering a particular position.
- The module connects the frontend with the backend to store and retrieve company information from MongoDB.

COMPANY MANAGEMENT APIs

1. Get Company Details

GET `/company/:id`

Purpose: Retrieves company information associated with a recruiter or company ID.

- Fetches the relevant company record from MongoDB.
- Retrieves details such as company name, location, description, website, and contact information, depending on the database structure.
- Returns the company information to the frontend.
- Displays the retrieved information in the Recruiter Dashboard.

2. Add Company Details

POST `/company`

Purpose: Adds a new company profile to the system.

- Receives company information from the frontend.
- Validates the required company details.
- Stores the company record in MongoDB..

3. Update Company Details

PUT `/company/:id`

Purpose: Updates the existing company information.

Request example:

```
{
  "name": "ABC Technologies",
  "location": "Chandigarh",
  "description": "A technology company providing software development services.",
  "website": "https://example.com"
}
```

- Receives updated company information from the frontend.
- Identifies the company record using its ID.
- Validates the submitted information.
- Updates the company details in MongoDB.
- Returns the updated record or an appropriate confirmation message.

FEATURES OF THE RECRUITER DASHBOARD

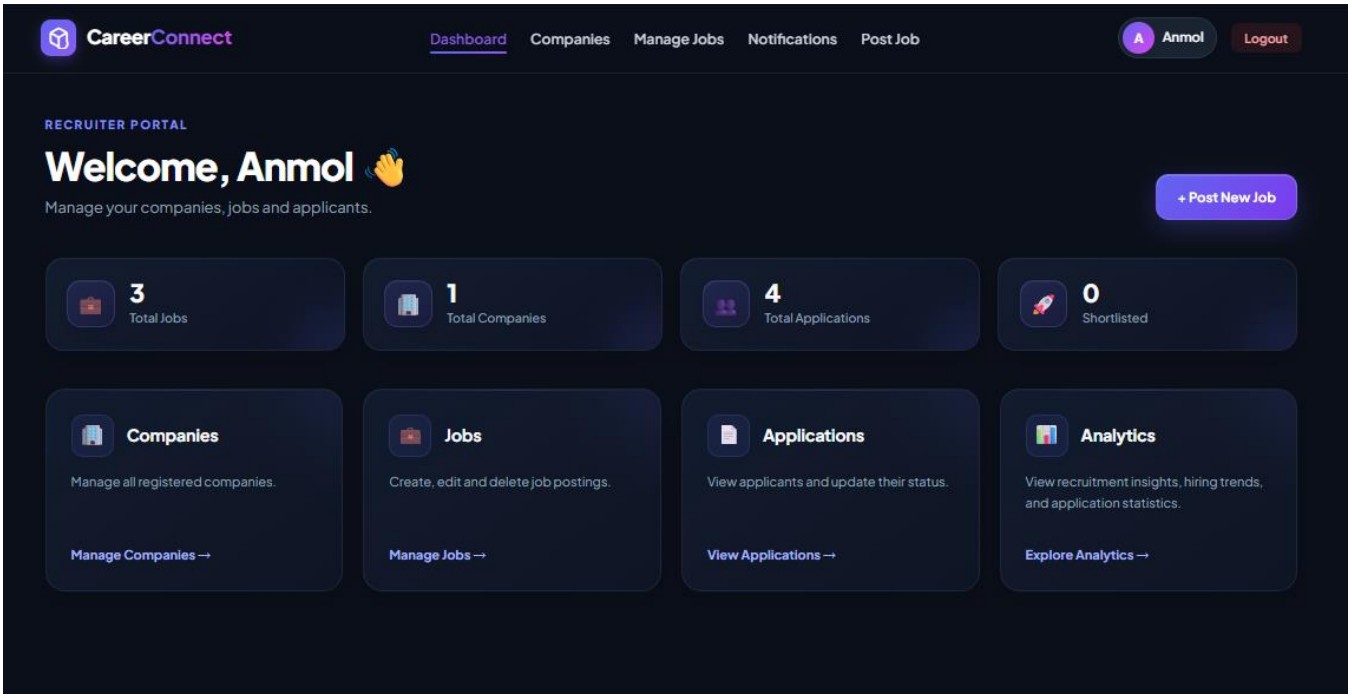

- Displays company information in an organized format.
- Allows recruiters to add company details.
- Provides functionality to update existing company profiles.
- Retrieves company information dynamically from the backend.
- Supports integration between company profiles and job listings.
- Uses React hooks to manage form data and display updates.
- Displays success and error messages for company-related operations.
- Helps recruiters maintain accurate company information for job seekers.

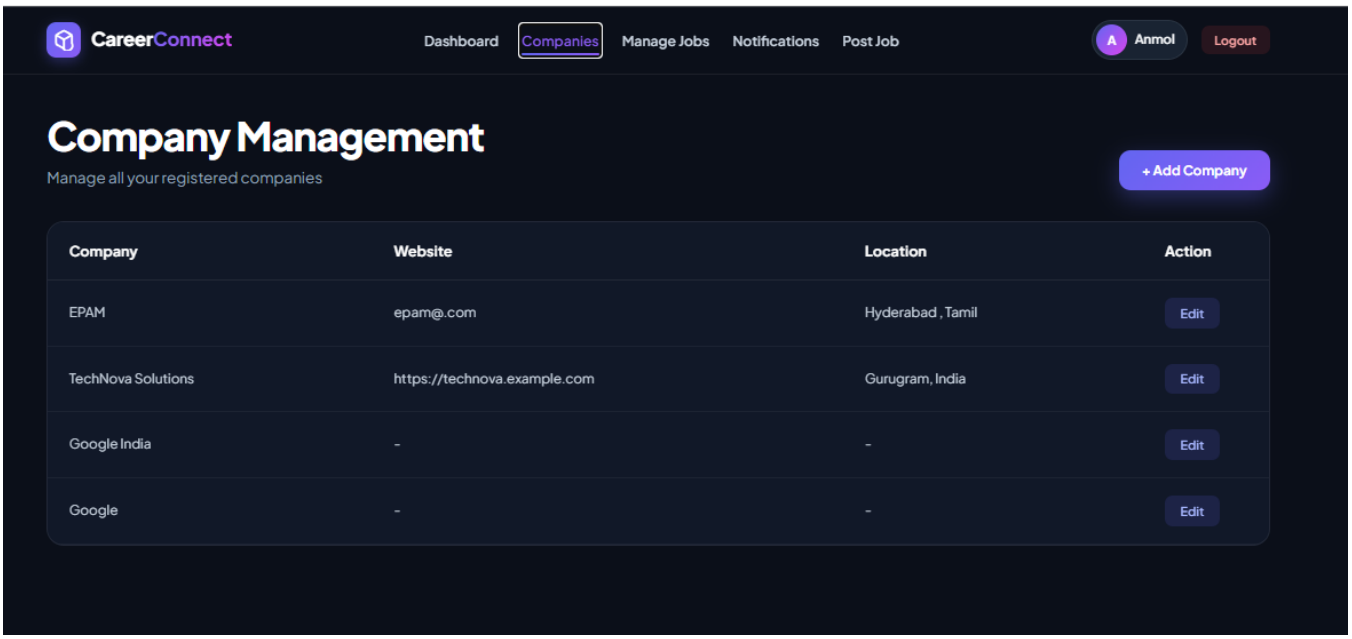

WORKING

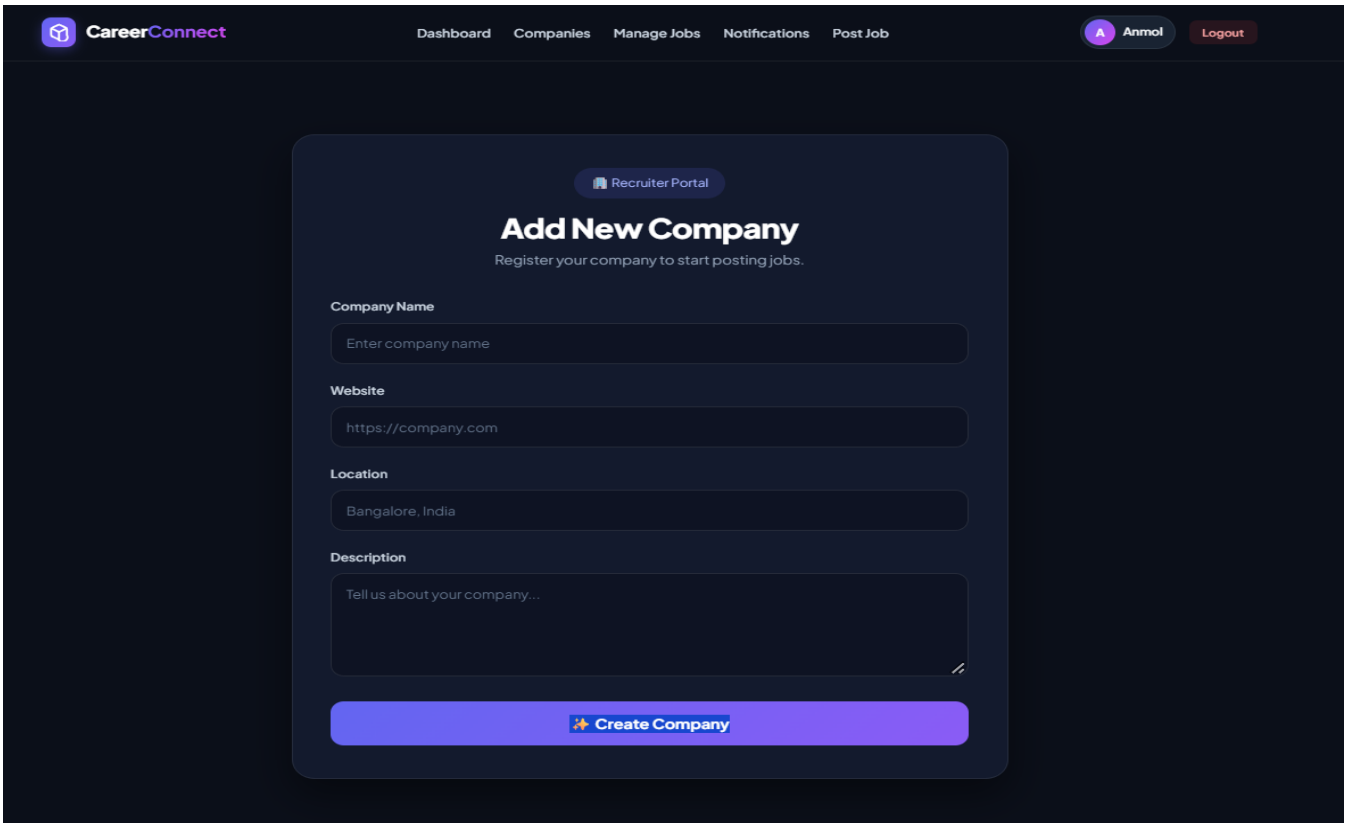

- The recruiter logs in to the CareerConnect – Career Guidance and Management System.
- The recruiter opens the Recruiter Dashboard.
- The frontend requests the existing company information from the backend.
- The backend retrieves the relevant company record from MongoDB.
- The company details are displayed in the dashboard.
- The recruiter can add new company information through the company form.
- The frontend sends the submitted information to the backend using the appropriate API.
- The backend validates the data and stores the company record in MongoDB.
- If the recruiter updates existing information, the Update Company Details API processes the changes.

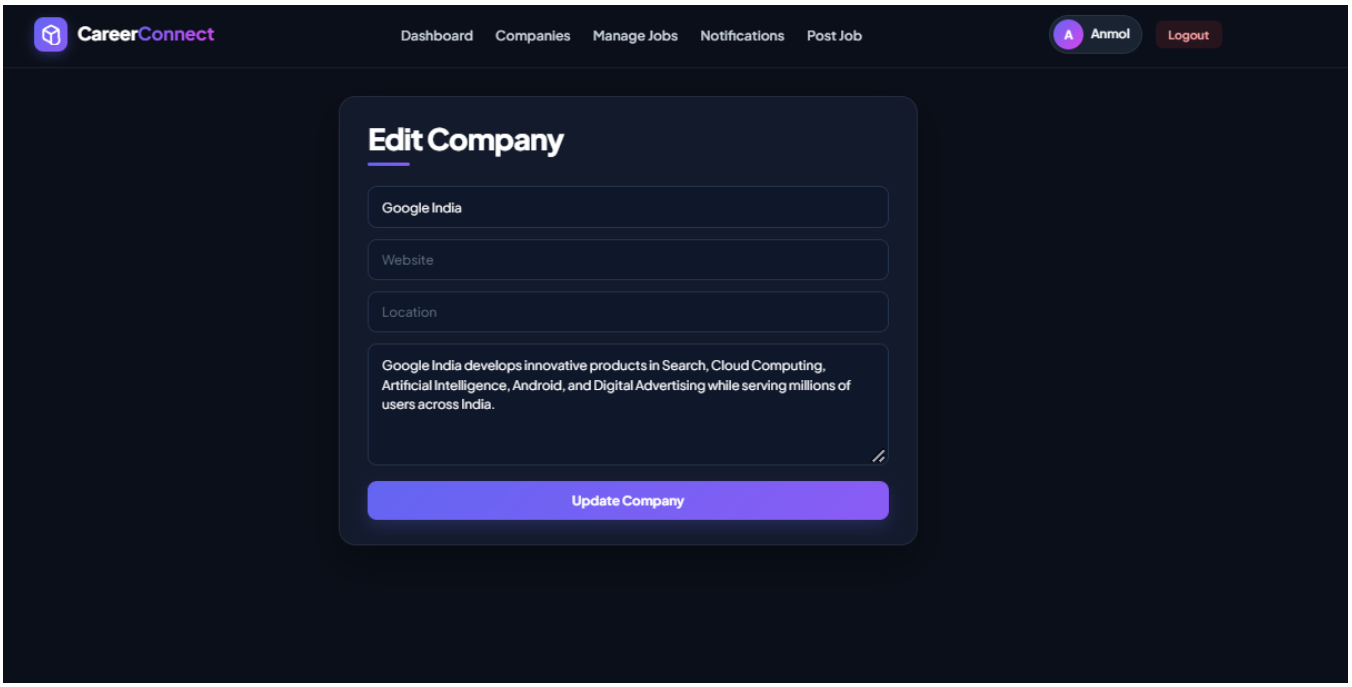

Conclusion

The Recruiter Dashboard and Company Management module provides a centralized interface for recruiters to maintain company information within the CareerConnect system. It enables recruiters to manage company profiles and supports the display of relevant company details alongside job opportunities. The integration of React.js, Node.js, Express.js, and MongoDB helps manage company data efficiently. Through this development, I gained practical knowledge of dashboard development, REST API integration, React hooks, and database management. Overall, the module contributes to a more organized recruitment process and improves the presentation of company information to job seekers.
