MERN STACK

TRAINING TR-103 REPORT DAY 1

25 JUNE 2026

Overview:

The first day of the MERN Stack training introduced us to the basics of **HTML (HyperText Markup Language)**, which is the foundation of web development. I learned how HTML is used to structure web pages using different tags and elements also the basic HTML tags such as headings, paragraphs, bold and italic formatting, along with the creation of HTML tables using rows and columns. I also understood the use of **rowspan** and **colspan** attributes for merging table cells. The practical tasks helped us build simple web pages and strengthened our understanding of HTML fundamentals.

Learning Objectives:

- Introduction to HTML and its role in web development.
- Understand the structure of an HTML document.
- Learn basic HTML tags such as headings, paragraphs, bold, and italic tags.
- Create and format tables using `<table>`, `<tr>`, `<th>`, and `<td>` tags.
- Understand the use of **rowspan** and **colspan** for merging table cells.
- Build simple web pages using basic HTML elements

Introduction to HTML

HTML

HTML (HyperText Markup Language) is the standard markup language used to create and

structure web pages. It defines the layout of a webpage using different elements called tags. HTML is the foundation of web development and is supported by all web browsers.

HTML Tag

HTML tags are the building blocks of web pages, used to structure and format content. They guide browsers on how to display text, images, links, and other media.

Usually, most of the HTML tags contain an opening and a closing tag. Each tag has a different meaning, and the browser reads the tags and displays the contents enclosed by them accordingly. Some tags, like <img> and
, are self-closing. Essential tags include <!DOCTYPE html>, <html>, <head>, and <body>.

- <!DOCTYPE html> — tells the browser the document is HTML5.
- <html> — root element that contains the entire webpage.
- <head> — holds metadata and settings not shown on the page.
- <title> — sets the text shown in the browser tab.
- <body> — contains all visible webpage content.
- <h1> — largest heading, used for main titles.
- <h2> — second-level heading for subtopics.
- <h3> — smaller heading under <h2>.
- <h4> — further subheading level.
- <h5> — small heading used for minor sections.
- <h6> — smallest heading level.
- <p> — defines a paragraph of text.
-
 — inserts a line break.

HTML Table

An HTML table is used to organize and display data in a structured format using **rows** and **columns**. It is commonly used to present information such as student records, timetables, marks, employee details, and price lists in a neat and organized manner. HTML tables are created using the `<table>` tag, where each row is defined by the `<tr>` tag. Table headings are created using the `<th>` tag, while table data is inserted using the `<td>` tag. Tables improve the readability of data and make it easier for users to understand information displayed on a webpage.

Main tags used in an HTML table:

- `<table>` – Creates the table.
- `<tr>` – Defines a table row.
- `<th>` – Defines a table heading.
- `<td>` – Defines a table data cell.

HTML also provides two important attributes for merging cells:

- **`rowspan`** – Merges two or more rows vertically.
- **`colspan`** – Merges two or more columns horizontally.

These attributes help in designing complex and well-structured tables, making the presentation of data more clear, organized, and visually appealing.

Name	URN	CRN
Jeeya	2303002	2315266
Yash	2303009	2315268

Name	CRN	URN	Branch
Jeeya	2315266	2303002	B.Tech
Aditi	2315278	2303006	B.Tech
Ashmeen	2315245	2309854	B.Tech
Anjali	2305297	2303008	B.Tech
Yash	2305223	2303007	B.Tech

Colspan and Rowspan

Colspan and **Rowspan** are important attributes used in HTML tables to merge cells and create a more organized layout. They help present data clearly, especially when a table contains grouped or related information.

- **colspan** is used to merge two or more columns into a single cell horizontally.
- **rowspan** is used to merge two or more rows into a single cell vertically.

Using these attributes makes tables more flexible, improves readability, and allows complex data to be displayed in a neat and structured format.

<table>
<tr><td rowspan="3">Row 1,2,3</td><td colspan="2">Column 1 & 2</td></tr>
<tr><td>Item A</td><td>Item B</td></tr>
<tr><td colspan="2">data3</td></tr>
</table>

Time table					
Hours	Mon	tue	wed	thu	fri
	Science	Maths	Eng	computer	Arts

	Lunch				
	Science	Maths	Eng	computer	Arts
	Science	Maths	Eng	computer	Arts

Head1	Head2	Head3	Head4
span row	span cols		
	span cols		span both
	span row	span col	
		span both	

Conclusion:

By the end of Day 1, I gained a strong understanding of HTML fundamentals, including basic tags, text formatting, and tables. I also learned how to use **rowspan** and **colspan** to organize table data effectively. These concepts provided a solid foundation for creating simple and well-structured web pages.
