MERN STACK

TRAINING TR-103 REPORT DAY 4

29 JUNE 2026

Overview:

Today I started **CSS (Cascading Style Sheets).** I focused on the basics of CSS (Cascading Style Sheets**)**. I learned about the three types of CSS—Inline, Internal, and External—and their uses in styling web pages. I also learned about the **CSS Box Model**, which explains how spacing and layout are managed using content, padding, border, and margin. Practical exercises helped us understand how CSS enhances the appearance and structure of web pages.

Learning Objectives:

- Understand the purpose of CSS in web development.
- Learn the three types of CSS.
- Differentiate between Inline, Internal, and External CSS.
- Understand the CSS Box Model.
- Learn the concepts of content, padding, border, and margin.
- Apply CSS styles to create attractive web pages.

CSS Types

CSS can be applied to HTML in **three** different ways.

1. Inline CSS

Inline CSS is written directly inside an HTML element using the style attribute. It is used to style a single element and has the highest priority among all CSS types. It is suitable for small changes

or testing but is not recommended for large projects.

Features:

- Applied to a single element.
- Uses the style attribute.
- Has the highest priority.

2. Internal CSS

Internal CSS is written inside the <style> tag within the <head> section of an HTML document. It is used when styling is required for only one webpage and keeps the styles organized within the same file.

Features:

- Written inside the <style> tag.
- Used for a single webpage.
- Better organized than Inline CSS.

3. External CSS

External CSS is written in a separate file with the .css extension and linked to an HTML file. It is the most commonly used method because it allows the same stylesheet to be used across multiple webpages.

Features:

- Stored in a separate .css file.
- Can style multiple webpages.
- Easy to maintain and reuse.

CSS Box Model

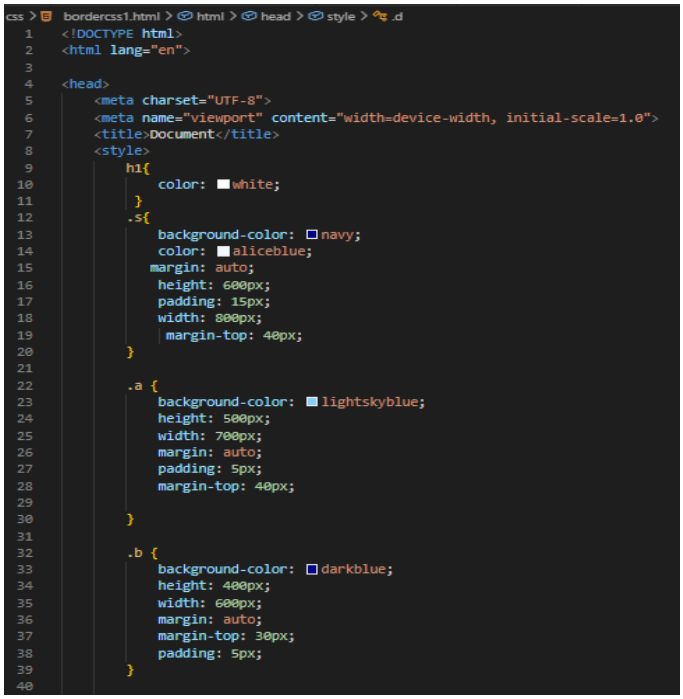

The CSS Box Model tells how every HTML element is displayed as a rectangular box. It helps control the layout and spacing of elements on a webpage.

The Box Model consists of four parts:

- **Content** – The area where text, images, or other elements are displayed.
- **Padding** – The space between the content and the border.
- **Border** – The outline surrounding the content and padding.
- **Margin** – The space outside the border that separates elements from each other.

The Box Model is essential for creating well-structured and properly spaced web pages.

Task:

```
<!DOCTYPE html>
<html lang="en">

<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <title>Document</title>
    <style>
        h1{
            color: white;
        }
        .s{
            background-color: navy;
            color: aliceblue;
           margin: auto;
            height: 600px;
            padding: 15px;
            width: 800px;
             margin-top: 40px;
        }

        .a {
            background-color: lightskyblue;
            height: 500px;
            width: 700px;
            margin: auto;
            padding: 5px;
            margin-top: 40px;

        }

        .b {
            background-color: darkblue;
            height: 400px;
            width: 600px;
            margin: auto;
            margin-top: 30px;
            padding: 5px;
        }
```

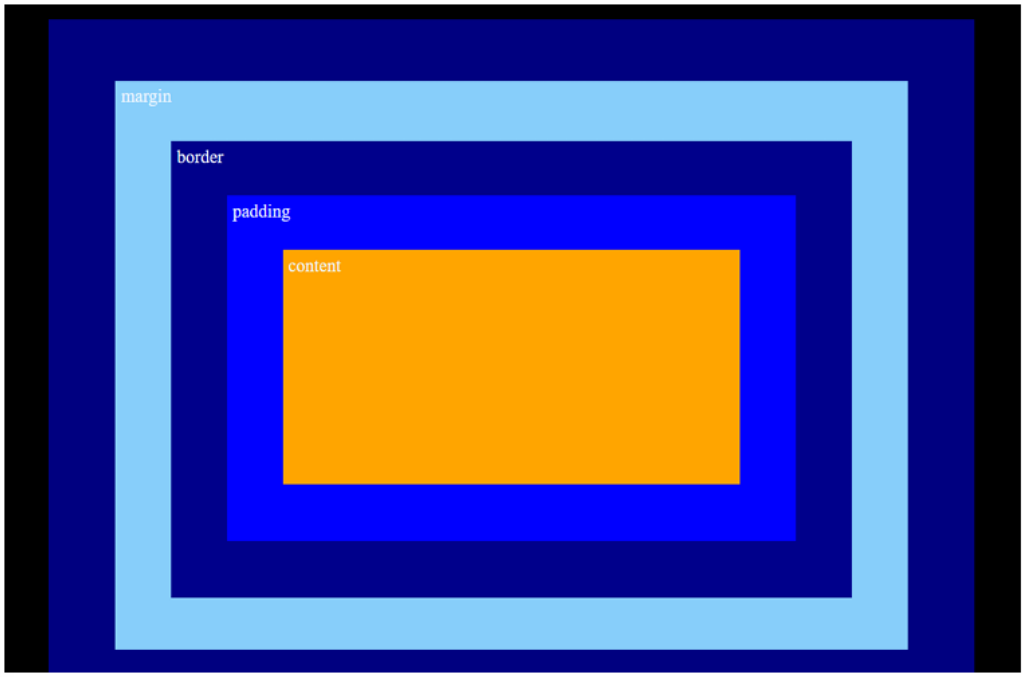

```
        .c {
            background-color: blue;
            height: 300px;
            width: 500px;
            margin: auto;
            margin-top: 25px;
            padding: 5px;
        }

        .d {
            background-color: orange;
            height: 200px;
            width: 400px;
            margin: auto;
            margin-top: 25px;
            padding: 5px;
        }
    </style>
</head>

<body bgcolor="black">
    <h1 align="center">TASK 2</h1>
    <div class="s">
    <div class="a">
        margin
        <div class="b">
            border
            <div class="c">
                padding<div class="d">
                    content
                </div>
            </div>
        </div>
    </div>
    </div>
</body>

</html>
```

Output:

Conclusion:

By the end of Day 4, I understood the purpose of CSS and learned the differences between Inline, Internal, and External CSS. I also gained a clear understanding of the CSS Box Model and how content, padding, border, and margin work together to create well-designed and properly spaced web pages.
