

ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING

TRAINING TR-102 REPORT DAY 19

17 July 2025

Overview:

Today, we explored the frontend setup for running Llama models using local environments. We learned how to interact with Llama models like Tiny Llama through a simple user interface using Ollama and a web-based frontend, usually running on localhost.

Learning Objectives:

- Understand what Llama frontend is and how it works.
- Learn to interact with Llama models using a web-based interface.
- Explore how to set up and run Llama using Ollama on a local system.
- Know the basic commands required to install, pull, and run Llama models.
- Discover how a frontend communicates with the backend through API calls.

Llama In Frontend:

The Llama Frontend is a web interface that allows users to chat with Llama models easily. Instead of using command-line inputs, we can ask questions or input prompts directly through a browser. This is especially useful when using models like Llama 2, TinyLlama, or CodeLlama locally via tools like Ollama or Text Generation WebUI.

Implementation Tools:

- Ollama: To run Llama models locally
- Flask / Node.js: For backend (if building custom frontend)
- HTML, CSS, JS: For designing the interface
- Localhost: Where the frontend runs (<http://localhost:11434> by default)

Basic Commands and Setup:

#Install Ollama

```
curl -fsSL https://ollama.com/install.sh | sh
```

#Pull and run a LLama model (e.g., TinyLlama)

```
ollama pull tinyllama ollama run tinyllama
```

#If we're using a frontend app with Flask

```
python app.py
```

Conclusion:

This session helped us understand how to make LLama models more accessible through a web frontend. Instead of relying only on CLI tools, we now know how to build or use a browser-based interface to interact with AI models. This improves user experience and opens doors for creating real-world AI applications like chatbots, educational tools, and assistants.
