MERN STACK

TRAINING TR-103 REPORT DAY 39

8 August 2026

Overview:

Day 39 of the MERN Stack training focused on developing the Recruiter Job Management, Post Job, and Notification modules for the CareerConnect – Career Guidance and Management System. I learned how to enable recruiters to create new job postings, manage existing vacancies, and view important recruitment updates. The Post Job module collects job-related information through a form and stores it in MongoDB using Express.js REST APIs. The Job Management module allows recruiters to view, update, and delete job listings, while the Notification module provides a centralized interface for displaying relevant recruitment activities. These modules integrate React.js, Node.js, Express.js, and MongoDB to support efficient job posting and recruitment management.

Learning Objectives:

- To understand recruiter-side job management functionality.
- To learn how to create and manage job postings using the MERN Stack.
- To implement form handling and data validation in React.js.
- To develop REST APIs for creating, retrieving, updating, and deleting job records.
- To understand how job information is stored and retrieved using MongoDB.
- To learn how notification records can be retrieved and updated.

Project: CarrerConnect – Carrer Guidance and Management System

RECRUITER JOB MANAGEMENT, POST JOB AND NOTIFICATION MODULES

1. RECRUITER JOB MANAGEMENT

- The Recruiter Job Management module is developed to allow recruiters to manage job vacancies posted on the CareerConnect system.
- It enables recruiters to view their posted jobs, update job information, and delete job listings when required.
- The module displays job details such as job title, company name, location, salary, job type, required skills, and job description.
- The module is implemented using React.js for the frontend and Express.js with MongoDB for backend operations.
- The `useState()` hook is used to manage job records, form inputs, and success or error messages.
- The `useEffect()` hook is used to fetch job listings when the recruiter dashboard is opened.
- Recruiters can manage their job postings through REST APIs connected to the backend.
- The module helps recruiters maintain accurate and updated job information for candidates.

2. POST JOB MODULE

The Post Job module allows recruiters to publish new job opportunities on the CareerConnect platform.

Job Details Include

1. Job Title
2. Company Name
3. Job Location
4. Job Type
5. Salary Details
6. Required Skills

7. Job Description

Post Job API

POST `/jobs`

- Receives job information submitted through the frontend form.
- Validates the required job details before saving the record.
- Associates the job posting with the relevant recruiter or company, where supported.
- Stores the job information in MongoDB.
- Returns a success response after the job is created successfully.
- Makes the job available for display in the job listings section, depending on the application's publishing workflow.

Working

1. The recruiter opens the Post Job page.
2. The system displays a form for entering job information.
3. The recruiter enters the required job details.
4. The frontend validates the form fields.
5. The submitted data is sent to the backend using the Post Job API.
6. The backend validates the information and creates the job record.
7. The job information is stored in MongoDB.
8. A success message is displayed after successful submission.
9. The newly posted job can be displayed in the job listings section.

3. NOTIFICATION MODULE

- The Notification module is developed to keep recruiters informed about important activities related to their job postings and recruitment process.
- It provides a centralized interface for viewing notifications generated by supported system activities.
- Notifications may include new job applications, application-related updates, and other

recruitment events, depending on the implemented features.

- The module uses React.js to display notification records and Express.js to handle backend requests.
- MongoDB stores notification information associated with the relevant user or recruiter.
- The `useState()` hook is used to manage notification records and read or unread status.
- The `useEffect()` hook is used to fetch notifications when the notification section is opened.
- The module helps recruiters monitor recruitment activities and access important updates conveniently.

Notification APIs

GET `/notifications/:userId`

- Retrieves notifications associated with a particular recruiter or user.
- Fetches notification records from MongoDB.
- Returns notification messages, dates, and read status, where available.
- Displays the retrieved information in the notification interface.

PUT `/notifications/:id/read`

- Updates the read status of a selected notification.
- Identifies the notification using its unique ID.
- Saves the updated notification status in MongoDB.
- Refreshes the notification list after a successful update.

Working

1. The recruiter logs in to the CareerConnect system.
2. The recruiter opens the Notification section.
3. The frontend requests notification records from the backend.
4. The backend retrieves the relevant notifications from MongoDB.
5. The notifications are displayed in the recruiter dashboard.

6. The recruiter views the notification messages.
7. If the mark-as-read feature is implemented, the recruiter can mark notifications as read.
8. The backend updates the notification status and returns a response.
9. The frontend refreshes the notification information.

4. RECRUITER JOB MANAGEMENT APIs

GET `/jobs`

- Retrieves job listings from the database.
- Returns job information to the frontend for display.

PUT `/jobs/:id`

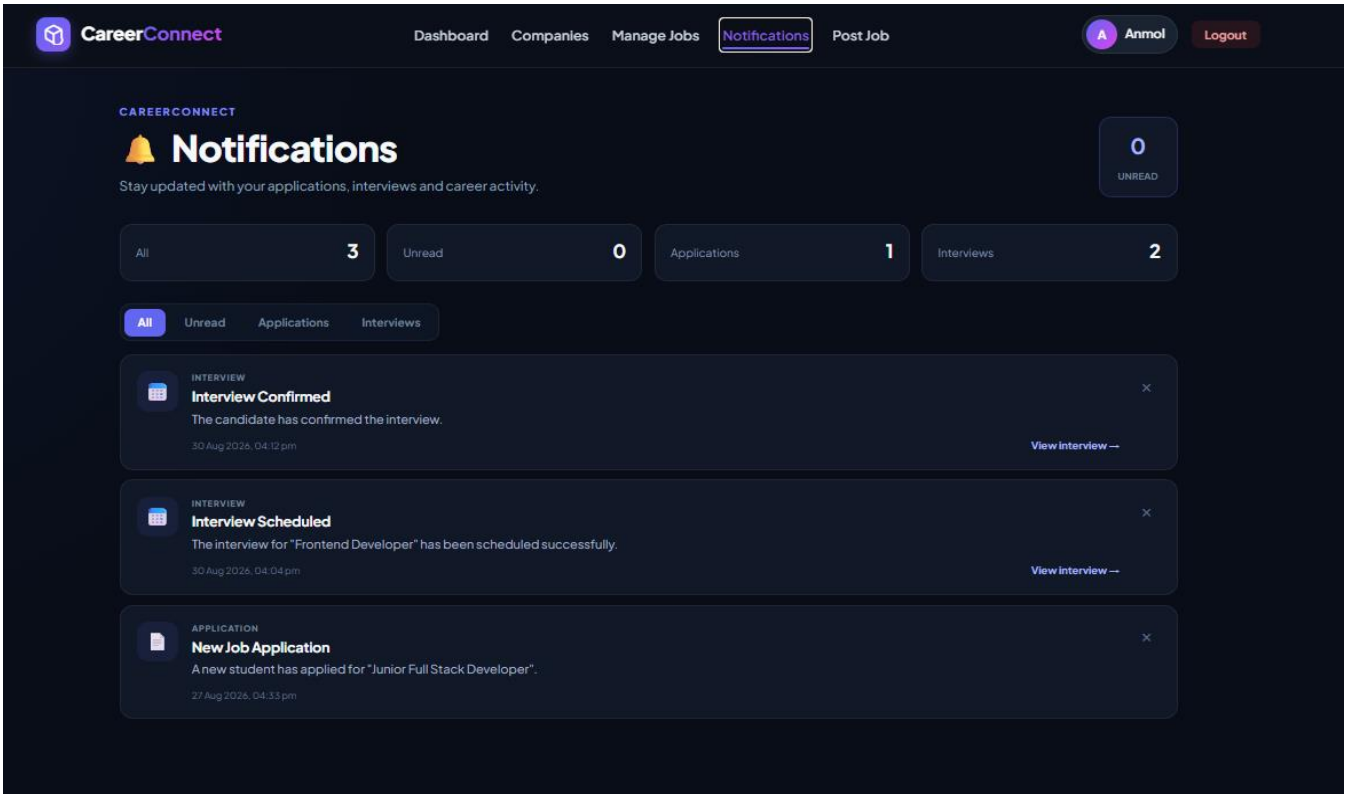

- Updates the information of an existing job posting.
- Allows recruiters to modify job details such as title, description, location, and salary.

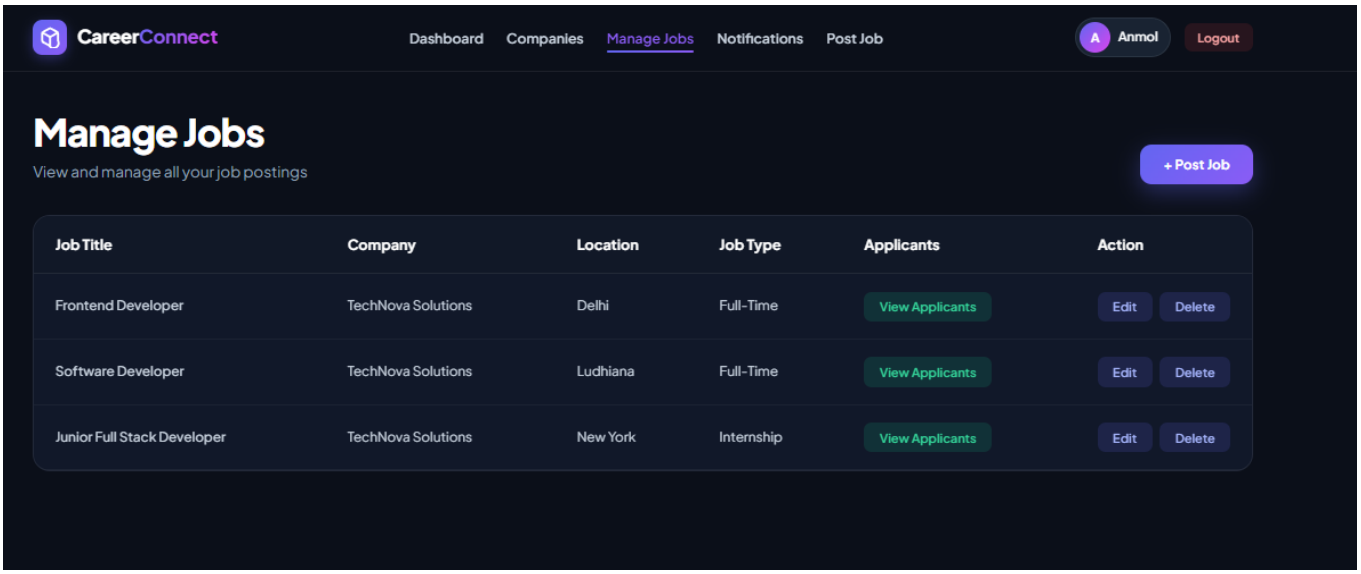

DELETE `/jobs/:id`

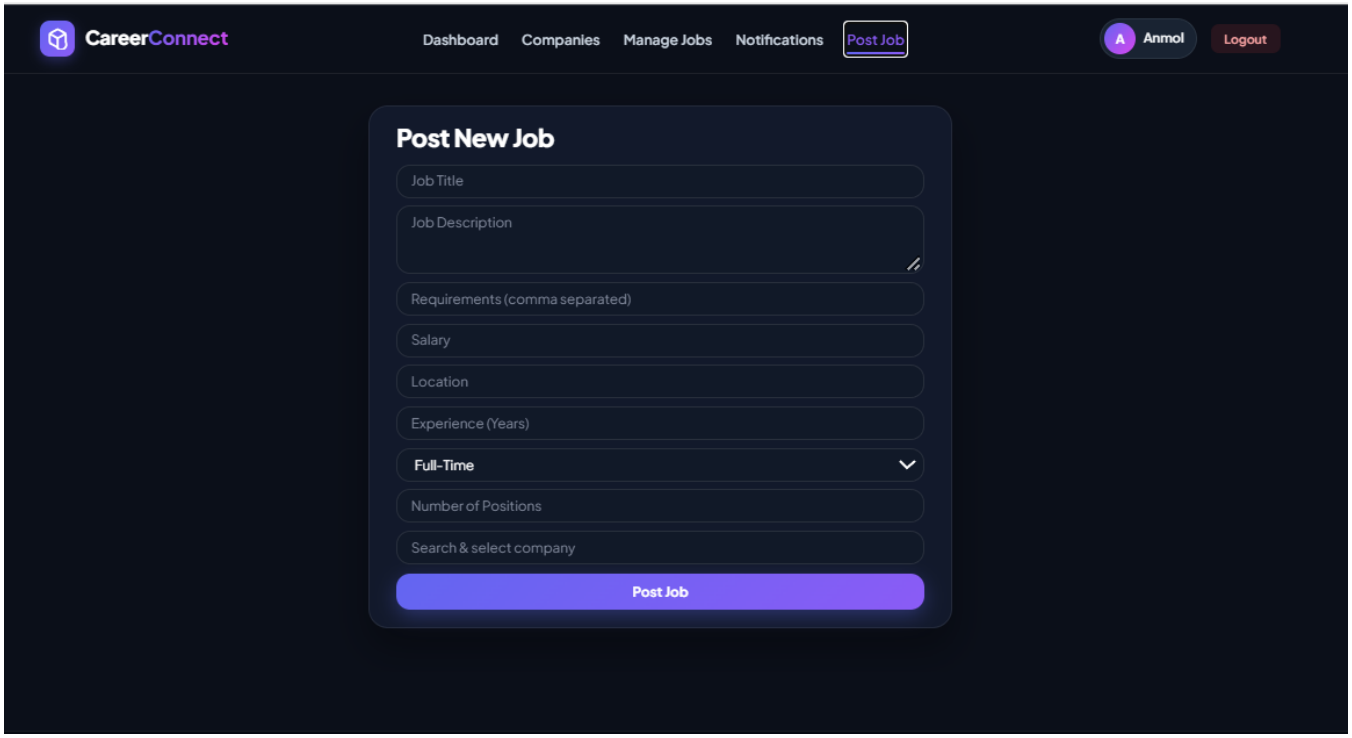

- Removes a selected job posting from the system.
- Updates the job listings after successful deletion.

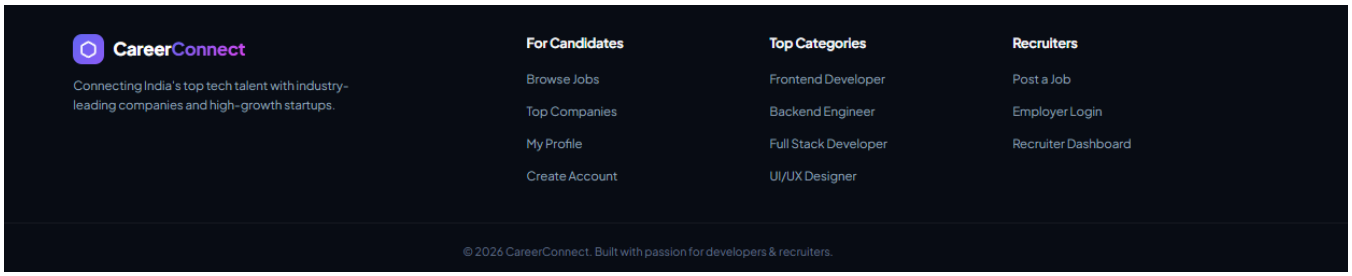

Conclusion

The Recruiter Job Management, Post Job, and Notification modules provide essential functionality for managing recruitment activities in the CareerConnect system. These modules enable recruiters to publish job opportunities, maintain existing job listings, and view relevant notifications through a centralized dashboard. The integration of React.js, Express.js, Node.js, and MongoDB supports communication between the frontend and backend and helps maintain job and notification records. Through this development, I gained practical knowledge of REST API integration, database operations, form validation, and full-stack application development using the MERN Stack.
